### Aims:

 To construct (modules of sections of) cotangent and spinor bundles over noncommutative surfaces (generalized Weyl algebras).

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

 To construct real spectral triples (Dirac operators) on noncommutative surfaces.

### The classical construction

- Let M be a surface.
- Construct a principal bundle

$$P \longleftarrow U(1)$$

$$\downarrow_{\pi}$$

$$M$$

such that  $T^*P$  is a trivial bundle, and

$$T^*M \cong P \times_{U(1)} V,$$

as (non-trivial) vector bundles, and

$$SM \cong P \times_{U(1)} W$$
,

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

as (trivial) vector bundles.

►

• Example: 
$$M = S^2$$
,  $P = S^3$ .

We need to consider:

- an algebra  $\mathcal{B}$  (of smooth functions on M),
- an algebra  $\mathcal{A}$  (of smooth functions on P).
- ▶ P is an U(1)-principal bundle over M means that A is strongly graded by Z, the Pontrjagin dual of U(1), and B is isomorphic to the degree-zero part of A.

- A first-order differential calculus ΩA on A (sections of T\*P) such that ΩA is free as a left and right A-module (triviality of T\*P).
- Restriction of  $\Omega A$  to a calculus  $\Omega B$  on B.
- Identification of ΩB in terms of sums of homogeneous parts of A (sections of T\*M ≅ P ×<sub>U(1)</sub> V).
- ► A candidate for a Dirac operator from the canonical connection on *A*.

We need to consider:

- an algebra  $\mathcal{B}$  (of smooth functions on M),
- an algebra  $\mathcal{A}$  (of smooth functions on P).
- ► P is an U(1)-principal bundle over M means that A is strongly graded by Z, the Pontrjagin dual of U(1), and B is isomorphic to the degree-zero part of A.

- A first-order differential calculus ΩA on A (sections of T\*P) such that ΩA is free as a left and right A-module (triviality of T\*P).
- Restriction of  $\Omega A$  to a calculus  $\Omega B$  on B.
- Identification of ΩB in terms of sums of homogeneous parts of A (sections of T\*M ≅ P ×<sub>U(1)</sub> V).
- ► A candidate for a Dirac operator from the canonical connection on *A*.

We need to consider:

- an algebra  $\mathcal{B}$  (of smooth functions on M),
- an algebra  $\mathcal{A}$  (of smooth functions on P).
- ▶ P is an U(1)-principal bundle over M means that A is strongly graded by Z, the Pontrjagin dual of U(1), and B is isomorphic to the degree-zero part of A.

- A first-order differential calculus ΩA on A (sections of T\*P) such that ΩA is free as a left and right A-module (triviality of T\*P).
- Restriction of  $\Omega A$  to a calculus  $\Omega B$  on B.

- ► A candidate for a Dirac operator from the canonical connection on *A*.

We need to consider:

- an algebra  $\mathcal{B}$  (of smooth functions on M),
- an algebra  $\mathcal{A}$  (of smooth functions on P).
- ► P is an U(1)-principal bundle over M means that A is strongly graded by Z, the Pontrjagin dual of U(1), and B is isomorphic to the degree-zero part of A.

Further we need:

A first-order differential calculus ΩA on A (sections of T\*P) such that ΩA is free as a left and right A-module (triviality of T\*P).

- Restriction of  $\Omega A$  to a calculus  $\Omega B$  on B.
- Identification of ΩB in terms of sums of homogeneous parts of A (sections of T\*M ≅ P ×<sub>U(1)</sub> V).
- ► A candidate for a Dirac operator from the canonical connection on *A*.

We need to consider:

- an algebra  $\mathcal{B}$  (of smooth functions on M),
- an algebra  $\mathcal{A}$  (of smooth functions on P).
- ▶ P is an U(1)-principal bundle over M means that A is strongly graded by Z, the Pontrjagin dual of U(1), and B is isomorphic to the degree-zero part of A.

- A first-order differential calculus ΩA on A (sections of T\*P) such that ΩA is free as a left and right A-module (triviality of T\*P).
- Restriction of  $\Omega A$  to a calculus  $\Omega B$  on B.
- Identification of ΩB in terms of sums of homogeneous parts of A (sections of T\*M ≅ P ×<sub>U(1)</sub> V).
- A candidate for a Dirac operator from the canonical connection on A.

Principal bundles vs. strongly graded algebras

- ► Let *G* be a compact Lie group and *M* a compact manifold.
- A compact manifold P is a principal G-bundle over M provided that G acts freely on P and M ≅ P/G.
- If G is abelian, freeness of action on M is equivalent to the strong grading of the algebra of functions on P by the Pontrjagin dual of G.
- ► U(1)-principal bundles correspond to strongly Z-graded (commutative) algebras.

Noncommutative U(1)-principal bundles ≡ strongly Z-graded (noncommutative) algebras.

### Strongly graded algebras

▶ Let G be a group. An algebra A is G-graded if

$$\mathcal{A} = igoplus_{g\in G} \mathcal{A}_g, \qquad \mathcal{A}_g \mathcal{A}_h \subseteq \mathcal{A}_{gh}, \quad orall g, h \in G.$$

• A is *strongly G*-*graded* provided, for all  $g, h \in G$ ,

$$\mathcal{A}_{g}\mathcal{A}_{h}=\mathcal{A}_{gh}$$

Strong grading is equivalent to the existence of a mapping

$$\ell: \mathbf{G} \to \mathcal{A} \otimes \mathcal{A},$$

such that

$$\ell(g) \in \mathcal{A}_{g^{-1}} \otimes \mathcal{A}_g, \quad m(\ell(g)) = 1.$$

(日) (日) (日) (日) (日) (日) (日)

•  $\ell$  is called a *strong connection*.

#### Strongness of the $\mathbb{Z}$ -grading

 A Z-graded algebra A is strongly graded if and only if there exist

$$\omega = \sum_{i} \omega'_{i} \otimes \omega''_{i} \in \mathcal{A}_{-1} \otimes \mathcal{A}_{1}, \quad \bar{\omega} = \sum_{i} \bar{\omega}'_{i} \otimes \bar{\omega}''_{i} \in \mathcal{A}_{1} \otimes \mathcal{A}_{-1},$$

such that

$$\sum_{i} \omega_i' \omega_i'' = \sum_{i} \bar{\omega}_i' \bar{\omega}_i'' = \mathbf{1}.$$

▶ Construct inductively elements:  $\ell(n) \in A_{-n} \otimes A_n$  as

$$\ell(\mathbf{0}) = \mathbf{1} \otimes \mathbf{1}, \qquad \ell(n) = \begin{cases} \sum_{i} \omega_i' \ell(n-1) \omega_i'' & \text{if } n > \mathbf{0}, \\ \sum_{i} \overline{\omega}_i' \ell(n+1) \overline{\omega}_i'' & \text{if } n < \mathbf{0}. \end{cases}$$

#### Strong $\mathbb{Z}$ -connections and idempotents

In a strongly Z-graded algebra A, A<sub>n</sub> are projective (invertible) modules over B = A<sub>0</sub>; they are modules of sections of line bundles associated to A.

• Write 
$$\ell(n) = \sum_{i=1}^{N} \ell'(n)_i \otimes \ell''(n)_i$$
.

Form an  $N \times N$ -matrix E(n) with entries

$$E(n)_{ij} = \ell''(n)_i \ell'(n)_j.$$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

• E(n) is an idempotent for  $A_n$ .

### Algebras we want to study: Quantum surfaces

- Let p be a polynomial in one variable such that p(0) ≠ 0 and q ∈ K, k ∈ N.
- B(p; q, k) denotes the algebra generated by x, y, z subject to relations:

$$xz = q^2 zx,$$
  $yz = q^{-2} zy,$   
 $xy = q^{2k} z^k p(q^2 z),$   $yx = z^k p(z)$ 

- The algebras B(p; q, k) have GK-dimension 2, and hence can be understood as coordinate algebras of noncommutative surfaces.
- ▶ If  $\mathbb{K} = \mathbb{C}$  and *p* has real coefficients, then  $\mathcal{B}(p; q, k)$  is a \*-algebra by  $y = x^*$ ,  $z = z^*$ .

#### Examples of quantum surfaces

• The Podleś sphere: k = 1, p(z) = 1 - z.

- The noncommutative torus: k = 0, p(z) = 1.
- The quantum disc: k = 0, p(z) = 1 z.

► Set:

$$p(z) = \prod_{l=0}^{N-1} \left(1 - q^{-2l}z\right).$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Then

(a) k = 0 – quantum cones,

- (b) k = 1 quantum teardrops,
- (c) k > 1 quantum spindles.

#### Examples of quantum surfaces

• The Podleś sphere: k = 1, p(z) = 1 - z.

- The noncommutative torus: k = 0, p(z) = 1.
- The quantum disc: k = 0, p(z) = 1 z.

Set:

$$p(z) = \prod_{l=0}^{N-1} \left(1 - q^{-2l}z\right).$$

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

Then

(a) 
$$k = 0$$
 – quantum cones,

- (b) k = 1 quantum teardrops,
- (c) k > 1 quantum spindles.

#### Algebras we want to study: Total spaces

- Let p be a polynomial,  $p(0) \neq 0$  and  $q \in \mathbb{K}$ ,  $k \in \mathbb{N}$ .
- Let  $\mathcal{A}(p; q)$  be generated by  $x_{\pm}, z_{\pm}$  subject to relations:

$$z_+z_- = z_-z_+, \quad x_+z_\pm = q^{-1}z_\pm x_+, \quad x_-z_\pm = qz_\pm x_-,$$
  
 $x_+x_- = p(z_+z_-), \qquad x_-x_+ = p(q^2z_-z_+).$ 

► View it as a Z-graded algebra with degrees of z<sub>±</sub> being equal to ±1, and that of x<sub>±</sub> being equal to ±k.

Define

$$\mathcal{A}(p;q,k) := \bigoplus_{n \in \mathbb{Z}} \mathcal{A}(p;q)_{nk},$$

- ▶ Note that A(p; q, 1) = A(p; q) with  $x_{\pm}$  given degrees  $\pm 1$ .
- ▶ If  $\mathbb{K} = \mathbb{C}$  and *p* is real then  $\mathcal{A}(p; q, k)$  is a \*-algebra via  $z_{\pm}^* = z_{\mp}, x_{\pm}^* = x_{\mp}$ .

# Examples of $\mathcal{A}(p; q)$

- $O(SU_q(2)) : p(z) = 1 z.$
- Quantum lens spaces :

$$p(z) = \prod_{l=0}^{N-1} \left(1 - q^{-2l}z\right).$$

#### Generalized Weyl algebras

[Bavula] Let R be an algebra, σ an automorphism of R and p an element of the centre of R. A degree-one generalized Weyl algebra over R is an algebraic extension R(p, σ) of R obtained by supplementing R with additional generators X, Y subject to the following relations

$$XY = \sigma(p), \quad YX = p, \quad Xa = \sigma(a)X, \quad Ya = \sigma^{-1}(a)Y.$$

- The algebras R(p, σ) share many properties with R, in particular, if R is a Noetherian algebra, so is R(p, σ), and if R is a domain and p ≠ 0, so is R(p, σ).
- ► A(p; q), B(p; q, k) are examples of generalized Weyl algebras (over R[z<sub>+</sub>, z<sub>-</sub>] and R[z], respectively).

#### Generalized Weyl algebras

[Bavula] Let R be an algebra, σ an automorphism of R and p an element of the centre of R. A degree-one generalized Weyl algebra over R is an algebraic extension R(p, σ) of R obtained by supplementing R with additional generators X, Y subject to the following relations

$$XY = \sigma(p), \quad YX = p, \quad Xa = \sigma(a)X, \quad Ya = \sigma^{-1}(a)Y.$$

- The algebras R(p, σ) share many properties with R, in particular, if R is a Noetherian algebra, so is R(p, σ), and if R is a domain and p ≠ 0, so is R(p, σ).
- ► A(p; q), B(p; q, k) are examples of generalized Weyl algebras (over R[z<sub>+</sub>, z<sub>-</sub>] and R[z], respectively).

Quantum principal bundles over quantum surfaces

#### Theorem

View  $\mathcal{A}(p; q, k)$  as a  $\mathbb{Z}$ -graded algebra by considering  $a \in \mathcal{A}(p; q, k)$  to be of degree n if it has a degree kn in  $\mathcal{A}(p; q)$ . Then

(1)  $\mathcal{B}(p;q,k) \cong \mathcal{A}(p;q,k)_0$ , by identification  $x := x_- z_+^k$ ,  $y := z_-^k x_+$  and  $z := z_+ z_-$ .

(2) A(p; q, k) is a strongly  $\mathbb{Z}$ -graded algebra.

### Differential calculi

A first-order differential calculus on A is an A-bimodule ΩA with a K-linear map d : A → ΩA such that

(a) *d* satisfies the Leibniz rule: for all  $a, b \in A$ ,

$$d(ab) = d(a)b + ad(b);$$

(b)  $\Omega A$  satisfies the *density condition*:  $\Omega A = Ad(A)$ .

• If  $\mathcal{B} \subset \mathcal{A}$  is a subalgebra, then one can restrict  $\Omega \mathcal{A}$  to

 $\Omega \mathcal{B} := \mathcal{B} d(\mathcal{B}) \mathcal{B}.$ 

If A is a complex \*-algebra, then the calculus (ΩA, d) is said to be a \*-calculus provided ΩA is equipped with an anti-linear operation \* such that, for all a, b ∈ A, ω ∈ ΩA,

$$(a\omega b)^* = b^*\omega^*a^*$$
 and  $d(a^*) = d(a)^*$ 

(日) (日) (日) (日) (日) (日) (日)

 $\Omega \mathcal{B} := \mathcal{B}d(\mathcal{B})\mathcal{B}.$ 

If A is a complex \*-algebra, then the calculus (ΩA, d) is said to be a \*-*calculus* provided ΩA is equipped with an anti-linear operation \* such that, for all a, b ∈ A, ω ∈ ΩA,

$$(a\omega b)^* = b^*\omega^*a^*$$
 and  $d(a^*) = d(a)^*$ 

### Skew derivations

- Noncommutative vector fields do not normally satisfy the Leibniz rule, but often they do satisfy the skew Leibniz rule.
- By a skew σ-derivation on A we mean a pair (∂, σ), where σ is an algebra automorphism of A and ∂ : A → A is a linear map such that, for all a, b ∈ A,

$$\partial(ab) = \partial(a)\sigma(b) + a\partial(b);$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

- Fix a finite indexing set *I*, and let (∂<sub>i</sub>, σ<sub>i</sub>), i ∈ I, be a collection of skew derivations on an algebra A.
- Let  $\Omega A$  be a free left A-module with a free basis  $\omega_i$ ,  $i \in I$ .
- Define the (free) right A-module structure on  $\Omega A$  by setting

$$\omega_i \boldsymbol{a} := \sigma_i(\boldsymbol{a}) \omega_i.$$

Then the map

$$d: \mathcal{A} \to \Omega \mathcal{A}, \qquad a \mapsto \sum_{i \in I} \partial_i(a) \omega_i,$$

satisfies the Leibniz rule.

There is no guarantee in general that the density condition be satisfied.

## Skew derivations on $\mathcal{A}(p; q, 1)$

Theorem Let, for all  $a \in \mathcal{A}(p; q, 1)$ ,

$$\sigma_{\pm}(a)=q^{|a|}a, \quad \sigma_0(a)=q^{2|a|}a, \quad c(z):=qrac{p(q^2z)-p(z)}{(q^2-1)z}.$$

For all  $\alpha_{0,\pm} \in \mathbb{K}$ , the maps  $\partial_{0,\pm}$  defined on the generators of  $\mathcal{A}(p;q,1)$  by

$$\partial_0(x_+) = \alpha_0 x_+, \quad \partial_0(x_-) = -q^{-2} \alpha_0 x_-,$$
  
$$\partial_0(z_+) = \alpha_0 z_+, \quad \partial_0(z_-) = -q^{-2} \alpha_0 z_-,$$

and

$$\partial_{\mp}(x_{\pm}) = \partial_{\mp}(z_{\pm}) = 0, \quad \partial_{\mp}(x_{\mp}) = \alpha_{\mp}c(z)z_{\pm}, \quad \partial_{\mp}(z_{\mp}) = \alpha_{\mp}x_{\pm};$$
  
extend to the whole of  $\mathcal{A}(p; q, 1)$  as skew  $\sigma_{0,\pm}$ -derivations.

### Differential calculus on $\mathcal{A}(p; q, 1)$

#### Theorem

If  $q^2 \neq 1$  and  $p(z) \neq 0$  is coprime with  $p(q^2z)$ , then the system of skew-derivations  $(\partial_i, \sigma_i)$ ,  $i \in \{+, -, 0\}$ , defines the first-order differential calculus  $\Omega A$  on A(p; q, 1) with free generators  $\omega_+$ ,  $\omega_-, \omega_0$  and differential

$$d(a) = \partial_{-}(a)\omega_{-} + \partial_{0}(a)\omega_{0} + \partial_{+}(a)\omega_{+}.$$

In the case of p(z) = 1 - z, with properly chosen constants  $\alpha_i$ ,  $\Omega A$  is the (left-covariant) 3D calculus on the quantum group  $SU_q(2)$  introduced by Woronowicz.

where  $\beta_+, \beta_- \in \mathbb{K}$ 

The Dirac operator given by

$$D:=\triangleright\circ\nabla:\mathcal{S}\to\mathcal{S},$$

comes out as

$$D(as_+ + bs_-) = \beta_+ q^{-1} \partial_+(b) s_+ + \beta_- q \partial_-(a) s_-.$$

D is an even Dirac operator with the grading

$$\gamma: \mathcal{S} 
ightarrow \mathcal{S}, \qquad as_+ + bs_- \longmapsto as_+ - bs_-.$$

#### Theorem

Let  $\mathbb{K} = \mathbb{C}$ ,  $q \in (0, 1)$  and p be a  $q^2$ -separable polynomial with real coefficients. Choose  $\beta_{\pm}$  such that  $\beta_{\pm}^*/\beta_{\pm} < 0$ , and let  $\nu$  be a solution to the equation

$$u^2 = -q^3 rac{eta_-^*}{eta_+}$$

Then the linear map

$$J: S \to S, \quad as_+ + bs_- \mapsto -\nu^{-1}b^*s_+ + \nu a^*s_-,$$

equips D with a real structure such that D has KO-dimension two.
