Barycentric coordinates

Let $\Omega \subseteq \mathbb{R}^d$ be an arbitrary polytope with vertices v_1, \ldots, v_n .

Barycentric coordinates with respect to Ω are the functions $b_i \colon \Omega \to \mathbb{R}$, i = 1, ..., n s.t.

•
$$\sum_{i=1}^{n} b_i(v) = 1$$
 (partition of unity);

$$\sum_{i=1}^{n} b_i(v) v_i = v \text{ (linear precision);}$$

•
$$b_i(v_j) = \delta_{ij}$$
 (Lagrange property).

BC can be used as basis functions for **barycentric interpolation**: the function

$$f(v) = \sum_{i=1}^{n} b_i(v) f_i$$

interpolates the data f_i at the vertices v_i .

イロト 不得下 イヨト イヨト 二日

The property

$$b_i(v) \geq 0$$

is required or just beneficial in many applications:

- convex combinations instead of affine ones;
- f(v) lies inside the convex hull of the data f_i .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Barycentric coordinates cont.

- Introduced by A.F. Möbius, *Der Baryzentrische Calcul*, Barth, Leipzig, 1827.
- Unique for simplices;
- Convenient way to linearly interpolate data;
- Can be generalized in several ways to arbitrary polygons, polyhedra, higher dimensional polytopes, curves;
- Applications: **numerical analysis** (geometric modelling and computer graphics).

1. J. Warren, S. Schaefer, A.N. Hirani, M. Desbrun, *Barycentric cordinates for convex sets*, Adv. Comput. Math. **27** (2007), 319–338.

(Abstract) Algebra

(A, F)

$A \neq \varnothing$, F - set of operations $f: A^k \rightarrow A$, $k \in \mathbb{N}$.

- groups, rings, fields;
- vector spaces

Here we are interested in:

- affine spaces
- convex sets
- barycentric algebras

イロト イ団ト イヨト イヨト 二日

Affine spaces of \mathbb{R}^n

The line $L_{x,y}$ through $x, y \in \mathbb{R}^n$:

$$\mathcal{L}_{x,y} = \{ \underline{p}(x,y) := (1-p)x + py \in \mathbb{R}^n \mid p \in \mathbb{R} \}.$$

A subset $A \subseteq \mathbb{R}^n$ is a (non-trivial) **affine subspace of** \mathbb{R}^n if together with any two different points x and y it contains the line $L_{x,y}$.

イロト 不得 トイラト イラト 二日

Affine spaces of \mathbb{R}^n

Affine spaces as algebras: $(A, \underline{\mathbb{R}})$, where $\underline{\mathbb{R}} = \{\underline{p} \mid p \in \mathbb{R}\}$

イロト イポト イヨト イヨト 二日

Affine spaces of \mathbb{R}^n

The line $L_{x,y}$ through $x, y \in \mathbb{R}^n$:

$$L_{x,y} = \{\underline{p}(x,y) := (1-p)x + py \in \mathbb{R}^n \mid p \in \mathbb{R}\}.$$

A subset $A \subseteq \mathbb{R}^n$ is a (non-trivial) **affine subspace of** \mathbb{R}^n if together with any two different points x and y it contains the line $L_{x,y}$.

Affine spaces as algebras: $(A, \underline{\mathbb{R}})$, where $\underline{\mathbb{R}} = \{\underline{p} \mid p \in \mathbb{R}\}$

Elements of the affine hull of a set $\{x_1, \ldots, x_n\}$ of affinely independent elements as **affine combinations**:

$$x = \sum_{i=1}^{n} r_i x_i \text{ with } \sum_{i=1}^{n} r_i = 1,$$

where $r_i \in \mathbb{R}$. They may be obtained by composing basic binary operations p and they form an affine space isomorphic to \mathbb{R}^n .

Convex sets of \mathbb{R}^n

Let I° be the open interval $]0,1[\subset \mathbb{R}.$

• The line segment $I_{x,y}$ joining the points x, y of \mathbb{R}^n :

$$I_{x,y} = \{\underline{p}(x,y) \mid p \in I^{\circ}\}.$$

- A subset C ⊆ ℝⁿ is a (non-trivial) convex subset of ℝⁿ if together with any two different points x and y it contains the line segment I_{x,y}.
- Convex sets as algebras: $(C, \underline{I}^{\circ})$, where $\underline{I}^{\circ} = \{p \mid p \in I^{\circ}\}$.
- Convex polytopes = finitely generated convex sets.

Polygon coordinate systems

Let Π be a polygon: $(\Pi, \underline{I}^{\circ}) \leq (\mathbb{R}^2, \underline{I}^{\circ})$, with ordered vertex set $V = \{v_1, \ldots, v_n\}$. A coordinate system for Π is a map

$$\lambda: V \to I^{\Pi}; v \mapsto \lambda_v$$

such that $a = \sum_{v \in V} \lambda_v(a) v_i$ (linear precision property) holds, for all $a \in \Pi$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Let Π be a polygon: $(\Pi, \underline{I}^{\circ}) \leq (\mathbb{R}^2, \underline{I}^{\circ})$, with ordered vertex set $V = \{v_1, \ldots, v_n\}$. A coordinate system for Π is a map

$$\lambda \colon V \to I^{\mathsf{\Pi}}; v \mapsto \lambda_v$$

such that $a = \sum_{v \in V} \lambda_v(a) v_i$ (linear precision property) holds, for all $a \in \Pi$.

Partition of unity property: Σ_{ν∈V} λ_ν(a) = 1 follows from linear precision property;

• **BA:**
$$((I^{\Pi})^V, \underline{I}^\circ) \simeq (I^{\Pi \times V}, \underline{I}^\circ) \in \mathcal{B}.$$

Polygon coordinate systems

Theorem

The set K_{Π} of cooordinate systems on a polygon Π with vertex set V forms a convex subset of $I^{\Pi \times V}$ under pointwise barycentric operations.

Polygon coordinate systems

Theorem

The set K_{Π} of cooordinate systems on a polygon Π with vertex set V forms a **convex subset** of $I^{\Pi \times V}$ under pointwise barycentric operations.

Tools for

- comparing different coordinate systems (discrepancy fields);
- introducing new coordinate systems (cartographic coordinates)

イロト イヨト イヨト -

Sparse BC

• Local approach: cartographic coordinates.

• The key idea:

- decompose the polytope into simplices (*regions*)
- take the volumetric coordinates for the region within which a given point of the polytope lies.
- Any bias introduced by a particular decomposition may be removed by taking the average of a point's coordinates in each of the decompositions appearing in the orbit of a symmetry group.

イロト イ理ト イヨト イヨト

Mathematical description

- Cyclic graph C_n constituted by the vertices and undirected edges of the polygon: skeleton of the polygon Π.
- Chord in C_n: edge connecting vertices which are not adjacent.
- Chordal decomposition: system of n 3 non-crossing chords of C_n that decompose Π as a union of n - 2 simplices (triangles) whose vertices are vertices of Π.
- The n-2 triangles constitute the regions of the decomposition.
- Given any one chordal decomposition, we obtain others by the action of the dihedral group D_n as the automorphism group of the graph C_n.
- Leaving fixed the vertex set V of the polygon Π , the elements of D_n act on the n-3 chords of the decomposition.

Oriented, non-crossing chordal decompositions of hexagons

- 3 distinct decompositions of a hexagon into 4 triangles by means of three non-crossing chords;
- full set of representatives for the orbits of the dihedral group D_6 on the chordally subdivided graph C_6 .

Cartographic coordinates

Definition

Let δ be a chordal decomposition of Π with a specified CDS. Then the formula

$$\kappa_{\mathbf{v}} = \frac{1}{2n} \sum_{\mathbf{g} \in D_n} \mathbf{g} \delta_{\mathbf{v}}$$

gives the **cartographic coordinate function** of that CDS at a vertex v of Π .

Theorem

For each chordal decomposition δ of Π , Definition above specifies a coordinate system κ of Π .

$C{-}C$ discrepancy fields

Contour plot of the norm of the CDS $1^22^2 - 2^3$ discrepancy vector for a hexagon.
